Recommendation

1. exe ←

Full project → deployment
→ Streamlit

3 Build Model

↳ Hyperparameter tuning ✓

4. Evaluate the model

→ overfitting / underfitting

→ Regularization if reqd

5. Deploy the model

↳ model will be binary } ✓

→ UI to use the model

(Streamlit / Flask / Django)

1. EDA → Examine

→ Visualize

→ clean — Missing Value

— duplicates

— outliers

— Rename Column

— drop unwanted rows/cols

2. Split the data into train & test

1 train-test ✓

2 ↳ Stratified } ✓
→ shuffle
→ k fold

...				
100				

→ shuffle
 → Randomly Selected

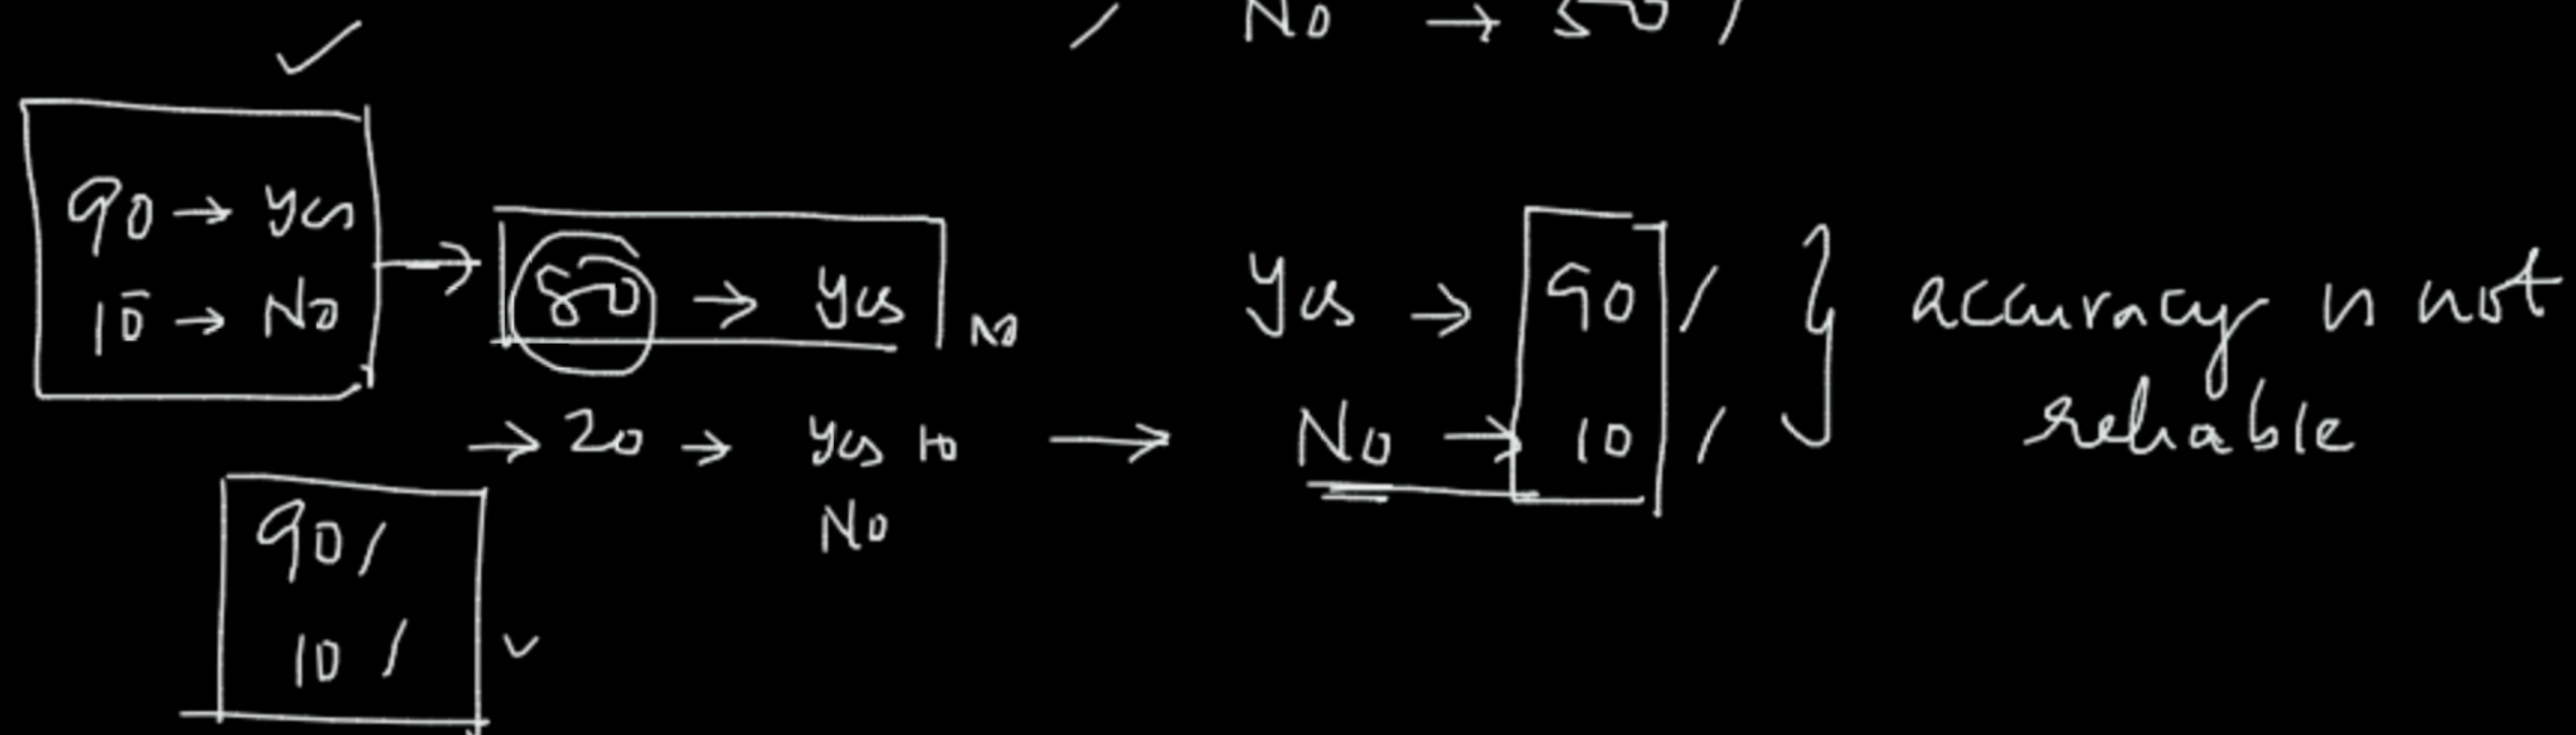

Data Validation

(2) Stratified splitting

— imbalanced data
 — No of classes in 'y'

✓ Yes → 50 /

✓ No → 50 /

(3) K-Fold Validation - less data

							Avg → overall accuracy

- No shuffling
- Guaranteed to test on every part of the data
- No overlap of testing data
Same record will not be tested twice

(3) Leave one out

- leave one record for test
- use the rest for training

(1-4) → 5th record ✓

1, 2, 3, 5 → 4th record

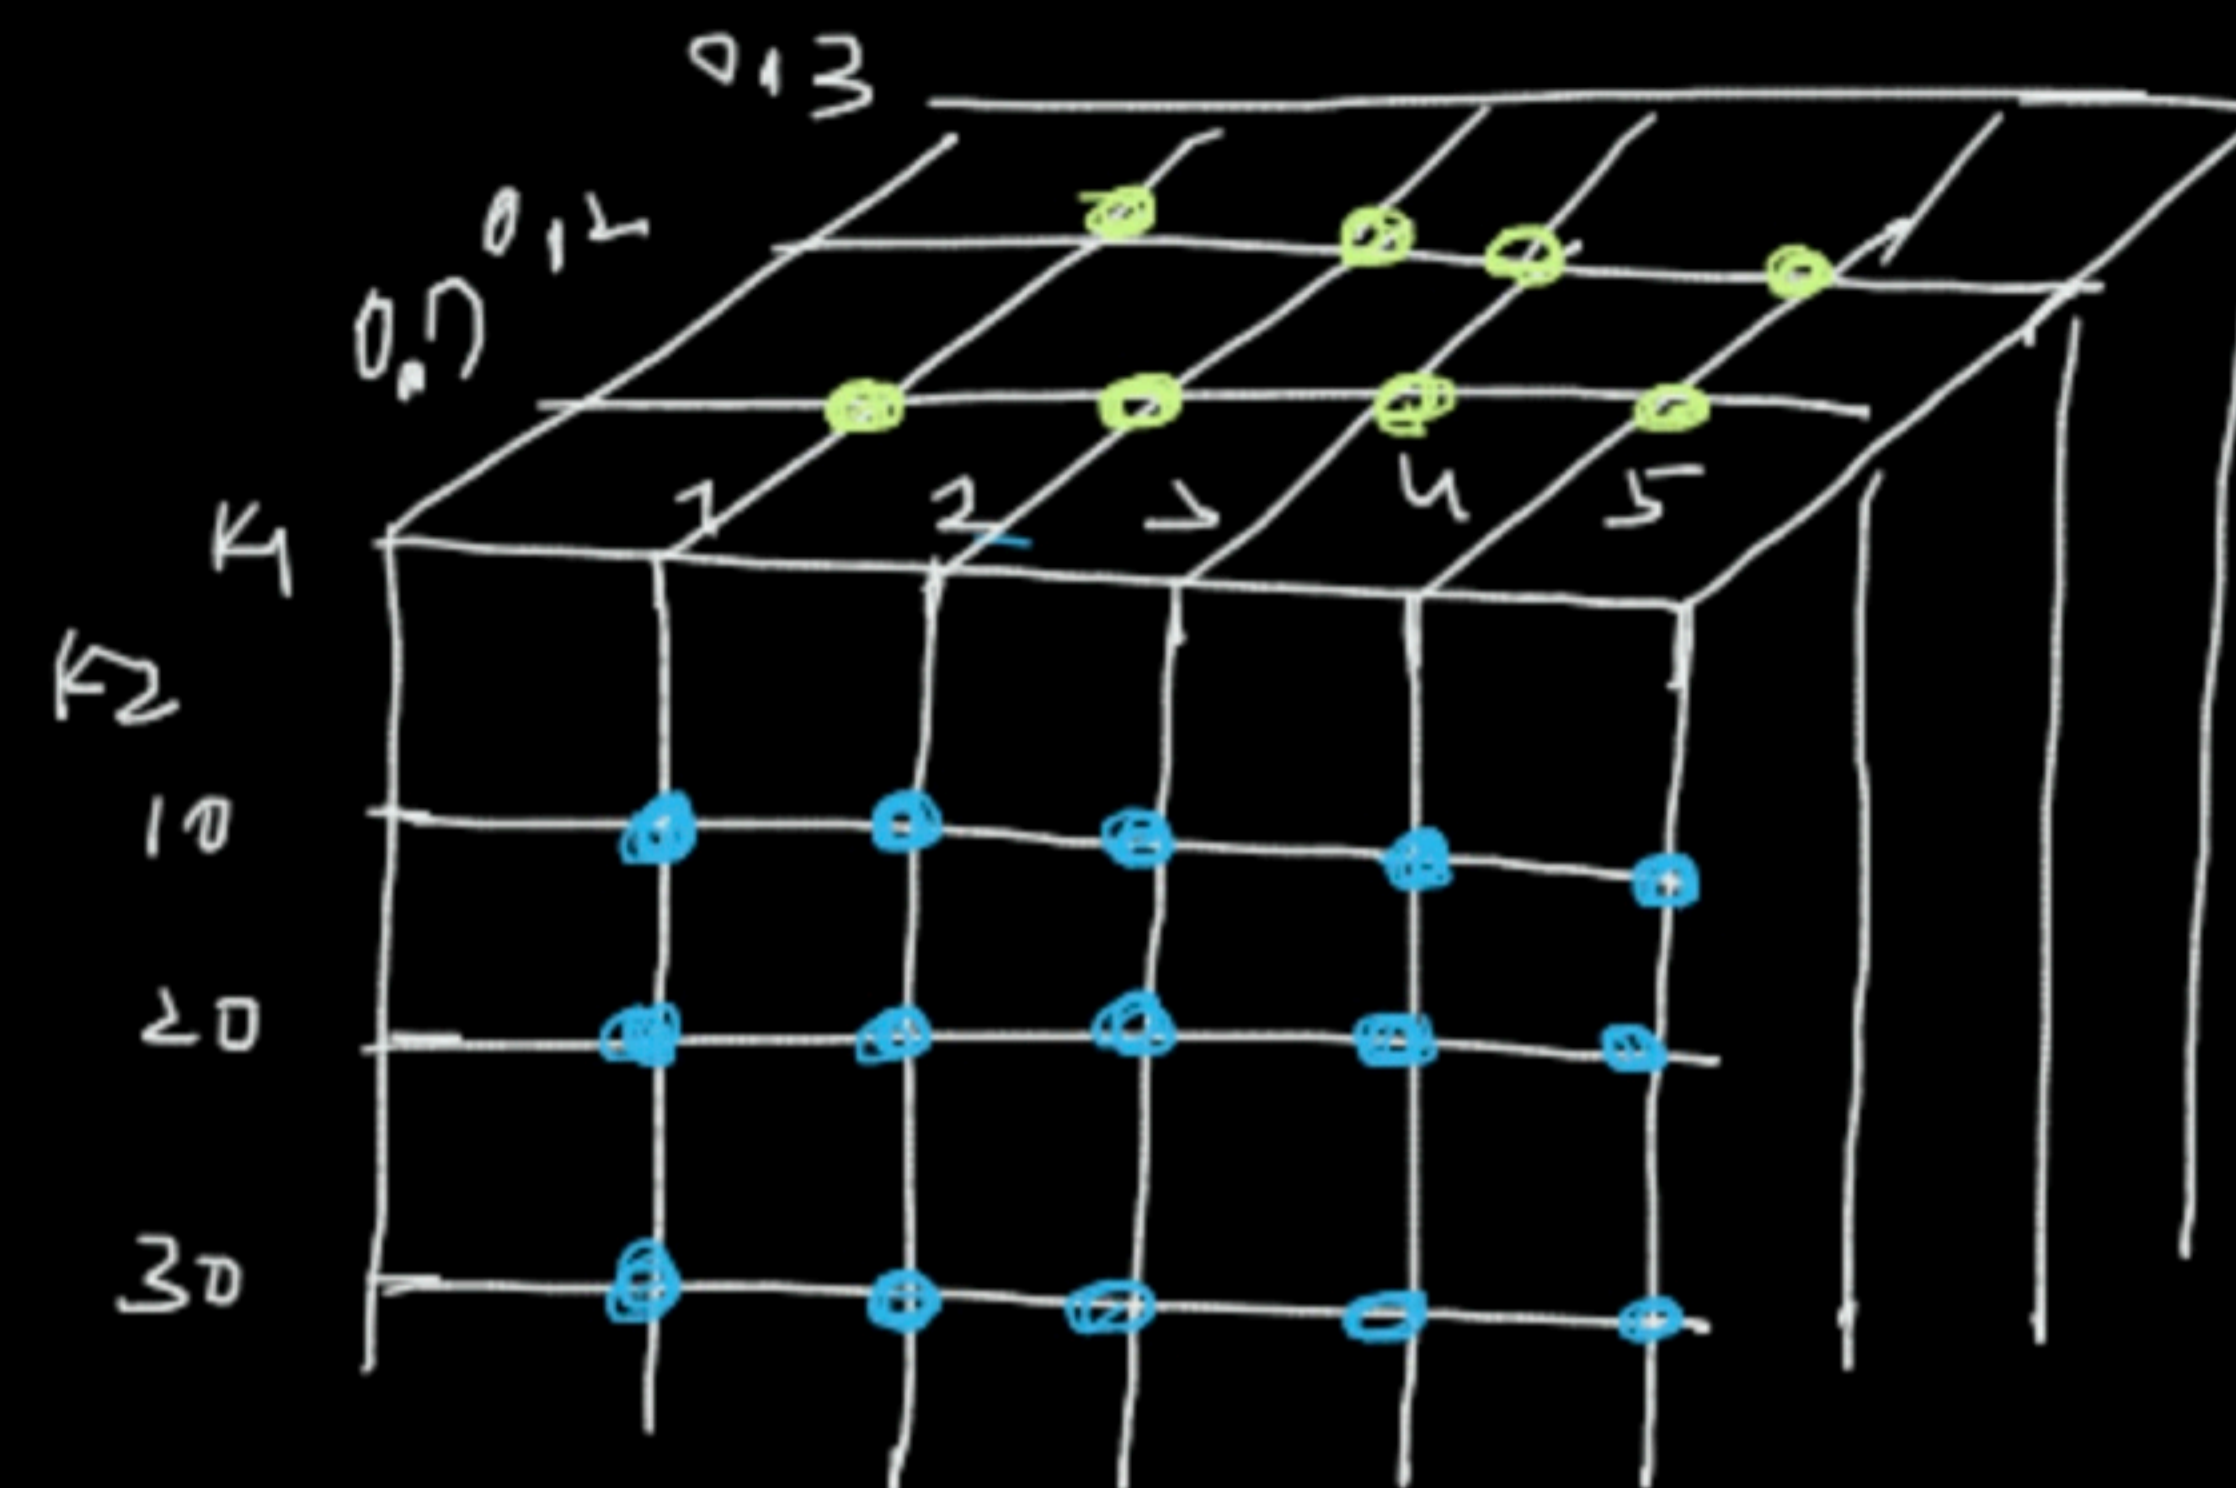

1, 2, 4, 5 → 3rd record

1, 3, 4, 5 → 2nd record

2, 3, 4, 5 → 1st record

(5) Shuffle split

- Shuffle & split multiple times (100, 200)
- No guarantee that every part of the data will be tested
